

A. Controlled denoising

Same target noise and transformer

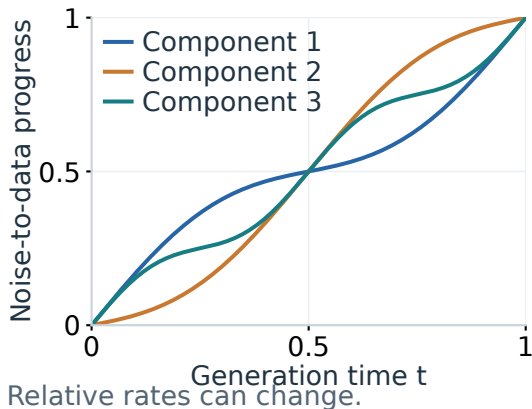

$$D_{j \rightarrow i} = L_i(\text{noisier } j) - L_i(\text{cleaner } j)$$

Positive D: cleaner j helps denoise i.

Repeat over noise levels and contexts.

B. Coordinate denoising

Illustrative; not measured

Scheduling tradeoff

Advancing j can help denoise i, but leaves less context for denoising j.
